ADU Academic Supervisor Observation Form
(Lesson Observation Notes Attached)

ADU Supervisor Name: Kesha Oliver	Date: October 22, 2025
ADU Student Teacher Name & ID: Dipti Razdan ID 1101823	
Mentor Teacher Name: Rafat Alwa	Observation Timing: 7:50AM
Placement School: Summit International School	Grade & Subject: 11 / ICT
	Number of Students: 10

Focus Area	Guiding Questions	CAEP Alignment	Score (1–3) 3 = Consistently demonstrated 2 = Sometimes demonstrated 1 = Limited evidence
Lesson Planning & Delivery	Is the lesson well-prepared and structured with a logical sequence of activities?	CAEP 1.1 (Content & Pedagogical Knowledge); CAEP 2.3 (Clinical Experiences)	3
Lesson Structure	Does the plan include clear introduction, development, plenary, reflection, and cross-curricular links?	CAEP 1.1 (Planning & Content Knowledge)	3
Learning Objectives & Success Criteria	Are lesson goals clear, measurable, and communicated to students?	CAEP 1.1 (Content Knowledge & Instructional Planning)	3
Resources & Technology	Are resources and technology appropriate, varied, and used effectively to support learning?	CAEP 1.5 (Use of Technology)	3
Differentiation	Are tasks adapted to support diverse learners, including those with varying ability levels?	CAEP 1.3 (Instructional Practice – Diverse Learners)	3
Student Engagement	Are students active, motivated, and involved in their learning?	CAEP 1.3 (Learner & Learning Environments)	3
Intellectual Quality	Are students challenged with higher-order thinking, problem-solving, and creativity?	CAEP 1.2 (Application of Content)	3
Assessment for Learning	Does the teacher check understanding, give feedback, and adjust instruction accordingly?	CAEP 1.4 (Assessment)	3
Classroom Management	Are routines, expectations, and behavior managed effectively to support learning?	CAEP 1.3 (Learning Environment)	2.5
Time & Transitions	Are transitions smooth and is instructional time used efficiently?	CAEP 1.3 (Instructional Practice – Learning Environment)	3

Total __29.5_ / 30

Dipti began the lesson with students seated at their tables and initiated a poll asking, “Where do you think Python is used in real life?” After students made their selections, she discussed each response, helping them connect their ideas to practical examples.

Next, she instructed students to identify five reasons to learn Python and share one example from their daily lives where Python could make a task more efficient. Students posted their responses on interactive AhaSlides after conducting brief online research. As they worked, Dipti encouraged collaboration and discussion among peers.

😊 Excellent job seamlessly connecting the lesson to students’ real-world experiences while integrating interactive technology to keep them actively engaged and motivated throughout the activity! 😊

Dipti then instructed the students to identify the most commonly reoccurring phrase or reason to use python. Students answered confidently and appropriately. She then had the students turn and talk about what they think Python is.

😊 Great job using collaborative strategies to keep students engaged in critical thinking! 😊

Afterward, Dipti provided students with the definition of Python and then introduced a short video explaining what Python is and how it can be used in real-world contexts to make everyday life more efficient and innovative. After the video, Dipti called upon students to think about where in the UAE python used in the UAE and then displayed when it was created.

Dipti then asked students why a red line appeared on the screen labeled “indentation.” Students responded that it indicated extra space, prompting Dipti to explain that proper indentation is essential when coding in Python. She then instructed students to watch a step-by-step video on how to use the Python compiler before giving them five minutes to explore the program without executing any commands.

As students explored, Dipti actively monitored their progress, checked for understanding, and ensured they remained on task.

😊 Well done actively monitoring students to keep them focused and supporting their understanding throughout the activity! 😊

Dipti engaged students in a discussion about the meanings of IDE and IDLE after allowing them time to research and explain the terms in their own words. She then elaborated on their responses, providing clear explanations to reinforce their understanding.

Following the discussion, students used the sample statements displayed on the screen and entered them into the program for hands-on practice. Afterward, they shared and discussed their results. When some students encountered a “syntax error,” Dipti guided them to identify and explain its meaning, which naturally led to further exploration of the difference between a syntax error and a name error—deepening their conceptual understanding through inquiry and discovery.

😊 Nice job using thoughtful probing questions to guide students’ thinking and promote the development of higher-order thinking (HOT) skills throughout the lesson! 😊

Dipti then prompted students to think of a way to print “Hello World” and “I am happy” using the IDE. She encouraged collaboration and peer support, fostering a cooperative learning environment that emphasized critical thinking and teamwork.

When all students encountered a command error, Dipti guided them in analyzing and explaining why the error occurred. She then invited one student to the board to write the correct command code while the rest of the class verified its accuracy, promoting active engagement and collective problem-solving.

Dipti then instructed students to place a “#” before the command and observe what happened. After making the adjustment, students noticed that the code ran correctly. Dipti followed up by asking, “Why is the code running correctly now?” prompting students to think critically about the function of comments in Python and deepening their conceptual understanding through guided questioning.

😊 Excellent use of purposeful questioning to challenge students’ thinking and inspire deeper analysis, reflection, and higher-order reasoning throughout the lesson! 😊

Next, Dipti instructed students to write their own comment using a single “#” and observe the outcome. Students discovered that the comment did not appear in the output. She then encouraged them to experiment by using three “#” symbols to see what would happen, and students observed that the comment became visible—helping them

understand how different uses of the “#” symbol can affect code interpretation in Python.

Dipti then introduced the Python code challenge to student groups, explaining that their task was to correct flawed Python snippets using one of two methods:

- Adding a meaningful comment
- Fixing indentation errors

She encouraged collaboration as students worked together to identify and apply the appropriate corrections.

Question to consider: What strategies could further support effective collaborative group work? Consider implementing Numbered Heads Together from Kagan structures to promote equal participation, accountability, and active engagement among all group members.

As student groups worked on completing their three tasks, Dipti circulated around the room, actively monitoring progress, checking for understanding, and providing support where needed. Her presence ensured that students remained engaged, clarified misconceptions in real time, and received individualized guidance to enhance their learning experience.

Dipti concluded the lesson by revisiting and restating the day’s learning objective, reinforcing what students had accomplished during the session. She then asked them to complete an exit ticket by writing what they understood easily and what concepts they felt needed further review.

😊 Great job ending the lesson by restating the learning objective and using an exit ticket to promote reflection and reinforce student learning! 😊

Assessment for Learning	Does the teacher check understanding, give feedback, and adjust instruction accordingly?	CAEP 1.4 (Assessment)	3
Classroom Management	Are routines, expectations, and behavior managed effectively to support learning?	CAEP 1.3 (Learning Environment)	2.5
Time & Transitions	Are transitions smooth and is instructional time used efficiently?	CAEP 1.3 (Instructional Practice – Learning Environment)	3

Total 29.5 / 30

Dipti began the lesson with students seated at their tables and initiated a review of the previous class by asking, “What is a name error, and when does it occur?” Students responded based on their understanding from the last lesson. She then instructed the students to log in to Aha Slides and participate in a live poll by responding to five review questions.

Next, she wrote the equation $2 + X = 7$ on the board and asked the students, “What does X represent?” Students correctly responded that it is a variable. Dipti then explained, “Today, we will learn how to solve for unknown variables in coding, just as you do when solving mathematical equations.” She followed this by calling on two students to read the definition of a variable and share what it means to them in their own words.

 **Excellent job clearly stating the learning outcome at the start of the lesson, helping students understand what they will be learning and focusing on today** 

Dipti then instructed the students to open their coding program and experiment by using both name and _name in their code to observe and compare the differences between the two. Students then were instructed to place a number in front of the name, but they encountered a syntax error and were instructed to use Google to investigate why the error occurred. They conducted their searches and successfully discovered that the error occurred because a variable name cannot begin with a number.

Students were then instructed to work in pairs to identify the naming conventions used for constants. As they collaborated, Dipti actively circulated around the classroom, monitoring their discussions, checking for understanding, and ensuring that all pairs remained on task.

 **Well done actively monitoring students to keep them focused and supporting their understanding throughout the activity!** 

Afterward, Dipti invited several students to come to the board and demonstrate how to correctly write a constant. She then instructed the class to complete the coding task in Aha Slides. Students were encouraged to first seek assistance from their peers if they encountered difficulties and to request the teacher’s help only if additional support was needed.

Question to consider: What strategies can be implemented to quickly and fairly select students at random? Think about how using random selection can promote equity and ensure that all students have an equal opportunity to participate. Think about name wheel/cards or random name generator (such as “Wheel of Names” or the random picker in ClassDojo) to quickly and fairly select students to answer questions or share ideas. This strategy keeps all students engaged, prevents bias, and ensures everyone has an equal chance to participate.

As students worked collaboratively in groups to complete the code, Dipti actively monitored their progress, checked for understanding, and ensured they remained on task.

 **Great job consistently circulating around the room to keep students engaged and providing guidance to support their understanding during the activity!** 

Following the group activity, Dipti reviewed the correct way to write the code with the class, eliciting feedback and explanations from students based on their responses. Students then proceeded to answer the related questions on Aha Slides.

The observation concluded at this point, as the ADU Supervisor needed to proceed to the next scheduled classroom observation.
